I will report on a progress in our joint work with Bruno de Oliveira. We call a symmetric holomorphic differential \$s\$ on a complex manifold closed if it can be written as $\rho df_i^{n_i}$ in the local neighborhood of some point \$x_0\$ of the manifold.

This property helds then for a complementary of a finite set of divisors and hence such a differential defines a holomorphic web- a set of local codimension one foliations on the manifold (possibly singular). Note that any symmetric differential on surface defines a similar web.However the webs defined by closed differentials are very special and provide with restrictions on the tolology of the ambient surface (or manifold). I will discuss some results and conjectures.
