PROGRAMM:

15:00 - 16:00 **Prof. Dr. Albrecht Klemm, University of Wisconsin/
Madison**

Mirror symmetry and the topological A- and B-model

Mirror symmetry on CY manifolds exchanges the symplectic structure on M , actually a complexified Kähler structure, with the complex structure on a mirror dual CY manifold W . The deformation theory of each of these structures can be described by a topological string theory called the topological A- and the B-model respectively. These models are cohomological theories defined by nilpotent operators Q_A and Q_B . We will show that Q_A exists on every symplectic manifold while Q_B exists only on CY manifolds and certain generalizations thereof. The latter fact is related to the Tian & Todorov theorem on the unobstructedness of complex structure deformations on CY spaces and generalizations by Hitchin. We will then discuss properties of cohomological theories notably the descend- and topological recursion relations. The solution of the topological B-model using these recursion relations and some classical methods of complex structure deformation theory on W is worked out and related by mirror symmetry to the Gromov-Witten theory captured by the topological A-model on M .

Aspects of Membrane Dynamics

The classical problem of 3-manifolds with vanishing mean curvature in Minkowski-space, locally equivalent to the dynamics of an irrotational 2-dimensional gas, has many fascinating aspects, including its non-commutative analogue, a 25 years old M(atrix)-Theory Model of physical relevance, still poorly understood, full of surprises.

17:00 - 17:30 Kaffeepause

17:30 - 18:30 **Dr. Simon Chiossi (HU)**

G2 structures on solvmanifolds

Conformally G2 manifolds are Riemannian manifolds with a G2 structure whose metric can be modified to a holonomy structure by a conformal change.

There is an interesting construction of homogeneous conformally G2 structures on solvmanifolds built from underlying SU(3) structures. I will show how the corresponding non-homogeneous G2 metrics can be obtained also by evolving the SU(3) structure in time. (Possible reference: arXiv math.DG/0510087)
